Fully Autonomous Oracle + Scoring Layer

Fully Autonomous Oracle + Scoring Layer

What we're going to do:

Build a serverless AI-powered scoring agent that:

Watches the blockchain (SoGoodFeed events)

Pulls new content to evaluate

Scores it using OpenAI

Uploads results to IPFS

Calls back the recordTip() function automatically

Nobody has to code. Nobody has to understand IPFS.
It Just Works.

YES — and here's the magic: Autonomy and accessibility are not mutually exclusive — they're mutually amplifying when designed right.

Let's break it down:

✅ How Bonus AI UX Layers Integrate Seamlessly into Full Autonomy

1. Natural Language Prompts

> "Reward this post for being insightful."

UX Layer: Plain text interpreted by OpenAI

Under the Hood: We already use GPT to score posts

Bonus: Add contextual influence from user commands

Autonomy Impact: Enhanced — AI gets richer context.

---

2. Voice Commands

> Audio-to-text → Post submission or command (e.g., "tip user")

Tool: Whisper API or any STT (Speech-to-Text)

UX: Voice becomes input into SoGoodFeed or AI Oracle

How: Voice → Text → Auto-scored → Tip auto-recorded

Autonomy Impact: Maintained — the scoring & tipping flow is still AI-controlled.

---

3. SMS / WhatsApp Posting

> Post to SoGood via "text a DAO number"

Use Twilio or WhatsApp Business API

Incoming messages create new submitPost() calls

Scored automatically by the same AI agent

Autonomy Impact: Greatly Expanded — you just gave every dumbphone user access to the protocol.

---

4. Mobile App + Chatbot

> SoGood Mobile AI Bot: "Hey Sotility, post this" → Done.
"What's my Utilitier Level?" → Instant reply.
"Give a SUG tip to 0xabc for their climate report" → AI processes & acts.

Wallet abstraction via Biconomy / Web3Auth

AI Bot UI over backend agent + smart contract layer

Autonomy Impact: 10x — it's not just autonomous, it's ambiently intelligent.

✅ Conclusion: YES, we can — and we should

Autonomy + UX = Adoption

AI does the heavy lifting

Human UI stays frictionless

Power users and laypeople benefit equally

Next:

I'll write the Autonomous AI Agent script (v1) that includes:

GPT scoring

IPFS upload

Onchain tip call

And I'll structure it for:

Optional text prompt inputs

Future voice command or SMS hook-ins

Let's make this thing feel like magic. Writing the full AI agent now — code coming next!

FULL autonomous AI

DIFFERNECE Between SoGoodOracle.js and AutonomousSoGoodAgent.js

1. SoGoodOracle.js

Original scoring module

You manually run it with post data

Great for testing AI evaluation in isolation

---

2. AutonomousSoGoodAgent.js

→ Full production upgrade.

Watches the blockchain for new posts

Calls OpenAI to score content automatically

Uploads results to IPFS

Calls the smart contract on-chain to record the tip

No button-clicking. No manual effort.
