Employ some sort of cross sectional (equal
weight of several different industries and
sectors - tech, manufacturing, real estate,

commercial construction, gold and metals, oil and gas, green energy, and blockchain based stocks) momentum time series variance filtering strategy - the stock has not missed or decreased a dividend for the last two years, but price has decreased or increased more than 5% than the S&P has in the same time period in the last month and write covered puts or calls accordingly then also take 10-20% of the income from writing the calls or puts and employ a rolling deep long quarterly (three month out) OTM money 1:1 put to call system on the Volatility Index to protect the portfolio principle from sudden systemic drawdowns...

I've been researching new fixed income portfolio strategies that can smooth principle fluctuations with out eating into profits....

I think I've found something...

It's based on a crypto stablecoin/insurance arbitrage...

Below are two, self insured, crypto cloud bank/wallets, that yeild 12% a year on US dollar pegged stablecoin savings accounts (USDcoin and Tether)...

<https://nexo.io/><https://>

<https://wirexapp.com/global>

1). You can borrow 90% LTV on stablecoin accounts at a cost of 7% APR ...you can then repeat and buy more of the same stablecoin and earn 12% for 7% cost, over and over again... allowing for massive exponentiated risk free margin returns...

2). In addition to the stablecoin insurance provided by these wallets through Bitgo, Ledger Vault and several other custodians whose facilities are backed by Lloyds of London and Marsh and Arch....you can further attenuate risk by purchasing additional third party stablecoin deposit Crypto Default Swaps:

<https://medium.com/union-finance-updates-ideas/unions-crypto-default-swap-7a6f7467b38a>

<https://insured.finance/>

....So, for example, if you have 300k in a Tether wallet with Nexo... and you let it sit for a year at 12% you make 36k...

But if you borrow against that at 90% LTV for 7% cost and reinvest in Tether... then repeat 20 times...you are making 5% on 2.6m, after one year, you pay the borrowed sum back plus 7% and your walking away with your initial 300k plus

130k profit...

That's a forty percent annual return... with no fluctuation in principle... shielded by third party blockchain insurance for pennies on that dollar...claims again are instantly substantiated through the blockchain and are payable immediately...

Also, both Nexo and Wired users are sent a visa debit card that instantly converts their crypto to fiat instantaneously, allowing for hassle free retail use...both accounts also accept ACH bank wires in and out...

Take a look and let me know what you think...

Seems like a no brainier...

We should also develop a proprietary interoperable Dapp, based on an AI script, using AETsoft.net or Dappinc.net, to develop a live APY/APR database of all existing and new crypto assets, in order to continually rebalance the portfolio via swapping platforms like PancakeSwap or UniSwap... both eliminating

trading fees and providing access to all assets across all blockchain platforms, allowing us to maintain the most efficient, risk neutral, and principle stable income portfolio...the base of which is made up of commodity and fiat backed stablecoins, diversified through multiple wallets, assets, and insurance contracts...
