Nixie MXC combination?

Hey Dad,

Here we go. Durning all of my research, I came across a company that is doing exactly what I was thinking regarding making each nixie clock a cross chain, Proof of Participation, consensus and reward node...

They are called the MXC Foundation and they have developed a parachain based hardware miner called the M2 Pro - which basically is a turn key, multi coin mining rig that plugs into the wall and then into an autonomous decentralized "Low-Power-Wide-Area-Network" via a QR code that you scan on its app called DataDash...

Here is the rig and the smart city vision ethos of network:

<https://matchx.io/pages/m2-pro-miner>

<https://matchx.io/pages/industrial-solutions>

Here is a link to the DataDash app that you use to link the rig to the network:

<https://apps.apple.com/us/app/datadash-app/id1509218470>

They have a partner program and we could tap into to integrate this technology into the clocks - they have the network going, we just plug into it and as value by stepping up the game by combining art, time, and technology... or we can just launch our Nixie Network into their IOT platform network as a white label...and BOOM we are rolling without having to build up our own IOT...

<https://matchx.io/pages/our-partners>

I honestly can't believe I stumbled upon this...

If we can combine the M2 Pro technology (or reverse engineer it) with the nixie clocks and start to develop a virtual autonomous renewable energy grid powered by a global network of low to no upfront cost, crypto and grant subsidised, solar paint sheet metal systems - with a focus on retrofitting and upgrading existing structures - from roofs to tractor trailers to airplanes and the hangers they sleep in... we can really make waves...

It would be a structural network of retrofitted solar sheet metal structures - an Internet of Solar Supernode Structures (IO3S) that plug or wirelessly upload to the Nixie Renewable Network where participators and producers can link to via an app on their phone or webpage on their desktop. Allowing them to monitor their total energy production, as well as their daily mining revenue, all of which is automatically swapped upon production into any stable coin, fiat currency, or crypto asset of your choosing....

We even have the Nixie Debt Card - both physical and virtual - that swaps any produced asset from your account and immediately swaps it to the necessary amount in the currency necessary for the transaction - say Euro in France or Yen in Japan...

Here are two companies we could use for that:

<https://www.hydrogenplatform.com/>

<https://www.fiatum.com/>

So we want to put a tokenized QR code on the side of each solar battery or nixie clock or M2 Pro type device that we install or sell - they download the Nixie app (just like DataDash), connect the solar battery to the metal or the clock into the wall or if it's a tractor trailer they can connect two or three M2 Pros to the solar battery we make each individual structure not only is a self sustained solar powered cross chain master "mining" node , but also a clean energy generator that uses a monetary

motivation mechanism which rewards both wirelessly transferring the energy into our nixie network or stacking rewards for cross chain mining and consensus solving - both increasing individual utility as well as participating in solving blockchain scalability issues and allowing for lower cost implementation of blockchain protocols into businesses and government and non profits, in turn increasing transparency, efficiency, and increasing overall utility of humanity...

The Nixie Network, like the M2 IOT, will be based on a Proof of Participation and Proof of Production consensus protocol...

Once you plug in to the Nixie Network, via either one of our sheet metal Solar systems, or by plugging a nixie clock into the wall...you start building your Participation capital in the network and the longer you participate you more rewards you earn.

Since we can partner with M2 and join into their established IOT cross chain mining pool, it will continues to scale the electricity costs out

horizontally thus making profitable off the bat - about \$10-12 a day at the moment. M2 doesn't have the Solar angle we do though...

If we can approach then with our Solar Structure nodal network and use it to subsidise the whole networks energy costs, then everyone makes more and we can use those funds to expand the retrofitting business and virtual Nixie Solar power plant...

Right now M2 mines only Polkadot, Bitcoin, MXC, and DHC...and as the IOT space continues to scale through interoperable cross chain node networks and Dapps, eventually it will reach what's called absolute atomic composibility - which is the most beautiful possibility that blockchain presents - making it possible to combine any number of blockchain applications, decentralized networks or distributed ledger systems all together in any and all possibilities, working all together, as a cohesive atomic entity or transaction that either succeeds as a whole or fails all together, paving the way for a more balanced equipartition of overall individual utility and resources, where invention, production and

creation that benefit and increase the utility of everyone are rewarded with increased resources, until a point of diminishing returns is reached and then either it's maintained or the excess rewarded resources are reallocated to motivate the next generation of innovation...

This will pave the way for ubiquitous decentralization, which inherently champions efficiency and transparency, in both the private and public sectors, allowing for consistent maximum efficiency/economies of scale - culminating into a global Blockchain of Blockchains where every phone and computer and electronic device on the planet participates in perpetuating and maintaining the Decentralization and all the benefits that come with it...

Sunrise Sheet Metal Solar:

So we want to develop a decentralised consumer driven virtual solar energy platform/ power plant, aimed at the micro-privatisation of energy generation and the income generated from it through a series of subsidised structural solar systems aimed at retrofitting everything from the entire exterior of homes and buildings, to tractor trailers and airplanes and tokenising and transferring said generated solar energy into the Nixie Renewable Energy Network or N-REN through a Wireless Power Transfer System...

Modern wireless power transmission techniques are more reliable, efficient. Wireless Power Transmission has improved significantly in the past 2-5 years.

The paper below describes the utilization of solar energy and the wireless transmission of the generated power. First the solar power is stored in a battery which is then transferred through wireless medium based on inductive coupling....the wireless power transfer system is a new way to transfer the power to the load rather than the conventional method of

transferring power through livewires...

We could use this technology to set up solar farms that couldn't be set up before because of their lack of access to grid stations...

<https://ieeexplore.ieee.org/document/6778505/>

<http://large.stanford.edu/courses/2018/ph240/macfarlane2/>

The N-Ren network can be based around a compounding stable coin reward mechanism embedded in low cost proof of participation and proof of production protocols that will perpetuate motivation and immediacy in both property owner and installer through the tokenization of every individual structure's solar systems and allow all parties to share in the energy generated revenue throughout the lifetime of each installed solar array...

The basis of this Solar Sheet metal structure system will be based on new photovoltaic paint

technology... the three majors of which are:

1). Hydrogen Solar Paint - this paint works by absorbing moisture from the air and using solar energy to break the water molecules into hydrogen and oxygen. The hydrogen can then be used to produce clean energy.

2). Perovskite Solar Paint - What makes Perovskite particularly interesting is the fact that they can take liquid form, thereby making them the ideal candidate for solar paint.

In fact, researchers have developed a way to spray liquid perovskite cells on surfaces, known as spray-on solar cells. The first-ever spray-on solar cell was developed at the University of Sheffield in 2014. A perovskite-based mixture was sprayed onto a surface to form a sun-harnessing layer.

3). Quantum “Colodial” Dot Photovoltaic Paint - There are two advantages to colloidal quantum dots. First, they’re much cheaper, so they reduce the cost of electricity generation measured in

cost per watt of power. But the main advantage is that by simply changing the size of the quantum dot, you can change its light-absorption spectrum. These dots could end up being up to 11% more efficient than traditional solar panels

<https://www.solarreviews.com/blog/solar-paint-hydrogen-quantum-dot-perovskite-solar-cells>

However, at the moment, above all of this technology, which is at our finger tips now .is integrating existing standing seam metal structures z with Thin-film PV Solar Laminates using a peel and stick method.

<https://www.roofingcalc.com/solar-pv-metal-roofing-guide/>

This is the way to go.

Let me know your thoughts.

or via power dumps freelanced collections
teams that earn a part of the energy they collect
and deposit into the N-Ren...

for both residential and commercial properties...
structural retrofitting the global network,

residual income participation for each party,
both owner and installer, of each newly installed
array...

Initially, heavier rewards should be paid to
installers focusing on low income housing and
build up to commercial real estate, to tractor
trailers, and to airplanes and the hangers they
sleep in...

This will jump start a more equal equipartition of energy benefits to the public. The goal with no upfront costs to the consumer or installer and perpetual participation in the crypto-production profits as long as the system is producing...

of a constant compensation cross chain global Internet of Structures network of low to no upfront cost, crypto subsidised, solar paint sheet metal systems - with a focus on retrofitting and upgrading existing structures - from roofs to tractor trailers to airplanes and the hangers they sleep in...

And when once we reach technological distributed ledger atomic composibility and its combined with autonomous AI based economic efficiency and financial transparency programs which are rewarded via energy powered by scalable renewable energy systems - and all financial knowledge, from government spending to corporate revenue allocations, down to the penny, are on the blockchain, and non-manipulable, to then the need for middle management blockchain decentralization the maximum efficiency/economies of scale allowable through the transparency that's championed by decentralized ledger technology.... that's a sort of all inclusive fully decentralized Blockchain of Blockchains where every phone and computer and electronic device on the planet participates in perpetuating and maintaining the universal implementation,

decentralisation, and monetary motivation mechanisms champion efficiency and transparency via reward protocols of every blockchain through ensuring transparency plan on adding they hundreds of other blockchains it can plug it's

When a miner plugs in the M2Pro and starts mining, the miner is proving his/her participation in the network by mining " data blocks ". This action is used to prove that the M2 Pro miner is in an operational state. Therefore, it requires little electricity

<https://matchx.io/pages/m2-pro-miner>
